Descriptive Report.
Eastern Part of Puget Sound Naval Station
Port Orchard, Wash.
Resurvey of Approaches
1897.

In 1897, after the grounding of the Battle Ship "Oregon", I was directed to make a careful Survey of the Approaches to the Port Orchard Dry Dock. This channel had been dredged since the Survey of 1895.

I found some changes, and additions to the topography, including the roads and walks. Some buildings had been removed and others constructed. The long wharf originally straight, had been changed, and there is now a bend about half way out.

On the other side of the channel is a wall of sheet-piling, extending out nearly 200 feet

In preparation for the Hydrography I laid off the wharf, making a mark, and numbering it consecutively, every five metres, - These marks, beginning on the stone casement just outside the Caisson, extended to the end of the wharf.

On the East-side of the channel were similar marks along the casement, and out to the

2

End of the wall of sheet-piling. - A buoy was
next anchored across the Channel, East of
the end of the wharf; and a rope, marked
every five metres was stretched from the buoy
to the end of the wall. - These marked points
are indicated on the sheet by red figures ^(0.25).

A long deep-sea lead line, was then marked
for every five metres, - and stretched across
the channel, the zero mark always at the
mark on the West side; soundings were taken
along this line at each mark. - and the
line then shifted to the next marks. - In
this way the whole channel was sounded,
and no space greater than five metres square
was missed. The results are shown on the
sheet. (after reduction to plane of reference.)

The plane of reference is the same as that
used in 1895, - being that adopted by the
Engineers of the Naval Station, and which is
0.77 ft. above the C. & G. Survey plane. -

The stone sill at entrance to dock, is 21
feet below the plane of reference, and as
the plane of reference is eleven feet
below the mean high waters, it is evident
that vessels drawing 30 feet can safely

Enter the dock at ordinary tides, and even
35 feet might be floated over the sill at extreme
tides.

The pumping machinery was set up by
Moran Bros. of Seattle, and, I understand,
is quite satisfactory.
